## ABSTRACT OF THE DISCLOSURE

Systems and methods for dynamically adding one or more document indicia when rendering an image without the use of a printer driver. In an image rendering system, a multi-subfile extension is used to represent multiple sub-images of a single page. A tree

5    extension is used to efficiently group and locate sub-images. A NewSubfile Type tag is used to support sub-image types for overlays, underlays and composites/matting. A tag is used for specifying the order to merge page and sub-images. A tag is used for specifying the relative location within a page or sub-image to merge another sub-image or page image. A tag is used for specifying the relating scaling of a sub-image within a page or sub-image when

10   merging the sub-image. A pre-fabricated form is used for page numbering. A pre-fabricated sub-image database of tile images is used for page numbers.
